## Programmable 2-wire Snap-on transmitter

Resistance transducer, thermocouple, voltage

Temperature linear or linear to specification

Additional alarm contact

Bargraph scalable

Galvanical isolation

### GENERAL

The universal 2-wire transmitter with bargraph display is the answer for measurement of temperatures and other electrical signals.

Its special feature is the bi-directional communication during configuration. By means of a PC and the standard programming kit, adjustment for the required sensor type, measuring range and parameters is performed.

The input is generally isolated from the output.

An additional relays output enables signalling of ex- or deceeding of input values.

The intrinsically safe version is suitable for application within explosion hazarded areas.

### DESCRIPTION

The transmitter has signal inputs for thermocouples/voltage and for resistive sensors. With thermocouple measurement, a built-in temperature sensor enables internal cold junction compensation. Optional an external sensor facilitates remote compensation. Resistive input is provided for Pt, Ni and Cu - type sensors. Measurement is possible in 2-, 3- and 4-wire connection.

Current measurements are possible by means of an external shunt and voltage input.
